

# Uranium Stabilization through Polyphosphate Injection: 300 Area Uranium Plume Treatability Demonstration Project

May 2, 2007

Dawn Wellman (PI)  
Vince Vermeul (TL)  
Mark Williams  
John Fruchter (PM)

# Hanford 300 Area in 1962

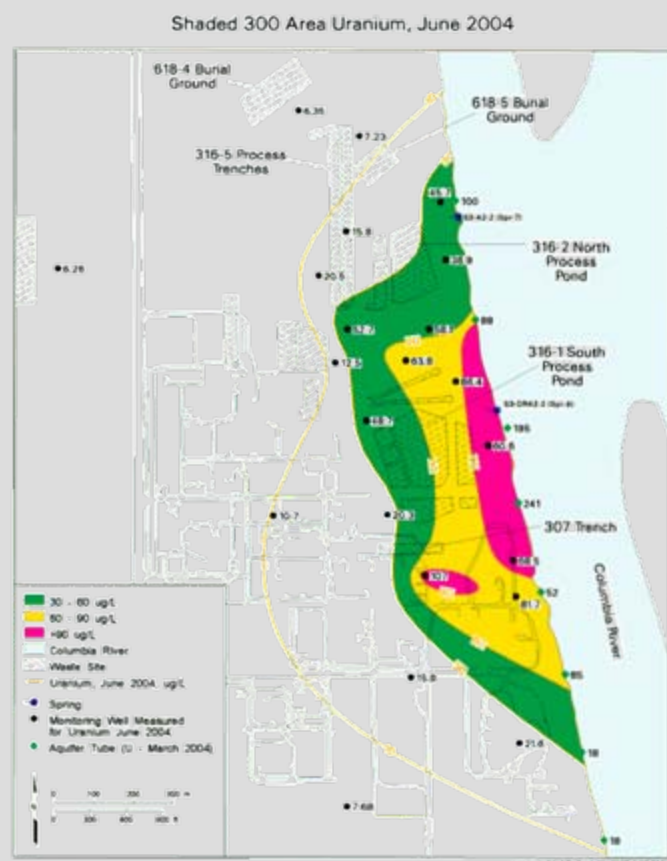

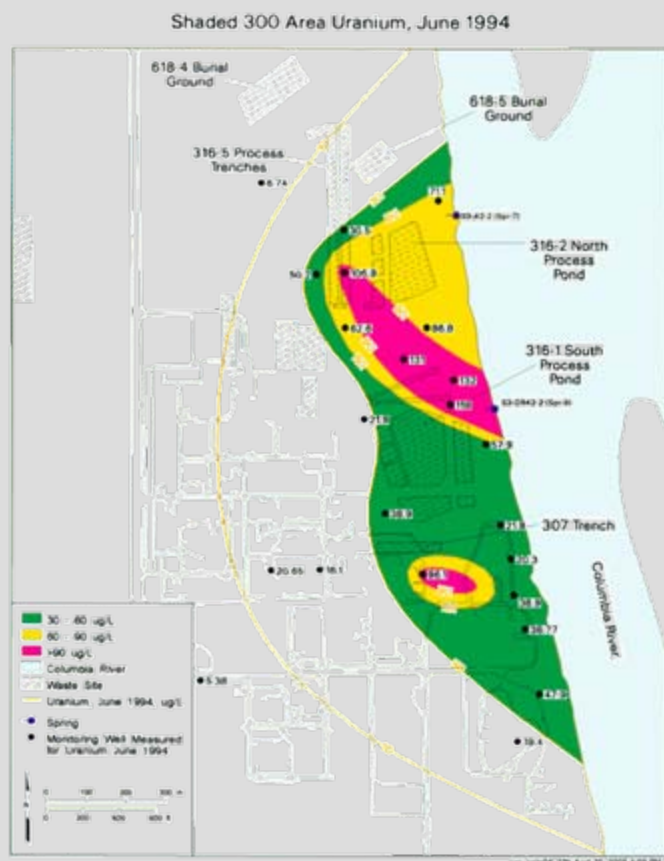

- ▶ North & South Process Pond Inventory  
37,000 – 65,000 kg of uranium
  - 1944 – 1954: Effluents from REDOX and PUREX process development
  - 1978 – 1986: N-reactor fuels fabrication wastes
  - Enriched, natural, and depleted uranium

# The Problem: Persistent Elevated Uranium in 300 Area Groundwater

## 300 Area Uranium Plume

Exceeding Current Drinking Water Standard 1994 & 2004

# Uranium-Phosphate (Autunite) Minerals

- ▶ Very low solubility.
- ▶ Formation does NOT depend on changing the redox conditions of the aquifer.
- ▶ Not subject to reversible processes such as reoxidation or desorption.

# Challenges to Phosphate Amendments: Rapid Precipitation Kinetics

- ▶ Injection of monophosphate molecules results in rapid flocculation and precipitation of phosphate phases
- ▶ Sharp decrease in hydraulic conductivity.

- ▶ Polyphosphate precludes rapid precipitation
- ▶ No measurable decrease in hydraulic conductivity

# Solution to Deployment Challenges: Use of Long-Chain Polyphosphates

- ▶ Slow reaction with water to yield orthophosphate
- ▶ Rate of hydrolysis is related to chain length
  - Time release - Controllable kinetics based on to polymer length
- ▶ Rate of phosphate mineral formation is directly related to the rate of polyphosphate hydrolysis.
  - Direct treatment of uranium
  - Provides immediate and long-term control of aqueous uranium

Polyphosphate amendment  
can be tailored to delay  
formation of autunite and  
apatite.

# Deployment of Phosphate Amendment for In-Situ Immobilization of Uranium

- ▶ Injection of soluble polyphosphate
- ▶ Lateral plume treatment
- ▶ Uranyl phosphate mineral (autunite) formation
  - Immediate sequestration
- ▶ Apatite formation
  - Sorbent for uranium
  - Conversion to autunite
- ▶ Enhancement of MNA

# 300 Area Tracer Injection Test

- ▶ NaBr tracer test on Dec. 13, 2006
  - Injection Well: 399-1-23
  - Targeted 60 ft diam. treatment volume
  - Injected Volume: 143,000 gallons
  - 200 gpm for 11.9 hrs
- ▶ Inline tracer mixing with water from Well 399-1-7 (620 ft DG)
- ▶ Br<sup>-</sup> conc. measured in injection stream and surrounding monitoring wells
  - Samples analyzed on site with ISE
  - Archive samples → verification by IC
  - Downhole ISE probes installed in all monitoring wells

# Tracer Test Results within Targeted Treatment Volume

$\bar{n}_{eff}$  (based on tracer arrival) = 0.18

- Consistent with LFI porosity estimates based on physical property analysis

# Tracer Results for Downgradient Wells 399 1-32 and 399-1-7

## 399-1-32 tracer drift data

- 399-1-17A
- Arrival in ~ 2 days
- $v = 50$  ft/d (15 m/d)
- $K = 14,000$  ft/d (4,300 m/d)
- $K_{fast} = 20,000$  ft/d (6,100 m/d)

## 399-1-7 tracer drift data

- First arrival after ~ 12 days
- Tracer plume well dispersed

399-1-3 ● 399-1-7

**\*\* Tracer drift data will be evaluated using a local-scale flow and transport model**

# **Uranium Stabilization through Polyphosphate Injection: Bench Scale Testing**

# Laboratory Testing Strategy

## ▶ $^{31}\text{P}$ NMR Hydrolysis Experiments

- Quantified the degradation of polyphosphates in groundwater and heterogeneous systems
  - Homogeneous degradation
    - Aqueous  $\text{HCO}_3^-$ ,  $\text{Ca}^{2+}$ ,  $\text{Na}^+$ ,  $\text{Al}^{3+}$ ,  $\text{Fe}^{3+}$ , and  $\text{Mg}^{2+}$ , pH = 6.5 – 8.0 at 23°C
  - Heterogeneous degradation

## ▶ Batch Tests

- Amendment Optimization
  - Down selected potential polyphosphate compounds
- Uranium Sequestration
  - Kinetics of uranium sorption on apatite as a function of pH
  - Loading density of uranium per mass of apatite as a function of pH
  - Kinetics and stability of sorbed uranium

## ▶ Column Tests

- Emplacement Efficiency
  - Amendment Transport
  - Autunite/Apatite Formation

# Possible Amendment Components

Amendment Source	Formula	Solubility, g/L cold H <sub>2</sub> O
Sodium Orthophosphate	$\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$	40.2
Sodium Pyrophosphate	$\text{Na}_4\text{P}_2\text{O}_7 \cdot 10\text{H}_2\text{O}$	54.1
Sodium Tripolyphosphate	$\text{Na}_5\text{P}_3\text{O}_{10}$	145.0
<del>Sodium Trimetaphosphate</del>	<del><math>(\text{NaPO}_3)_3 \cdot 6\text{H}_2\text{O}</math></del>	<del>Soluble</del>
<del>Sodium Hexametaphosphate</del>	<del><math>(\text{NaPO}_3)_6 \cdot 4\text{H}_2\text{O}</math></del>	<del>Very Soluble</del>
<del>Calcium Dihydrogen Phosphate</del>	<del><math>\text{Ca}(\text{H}_2\text{PO}_4)_2 \cdot \text{H}_2\text{O}</math></del>	<del>18</del>
<del>Calcium Hydrogen Phosphate</del>	<del><math>\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}</math></del>	<del>0.32</del>
<del>Calcium Pyrophosphate</del>	<del><math>\text{Ca}_2\text{P}_2\text{O}_7 \cdot 5\text{H}_2\text{O}</math></del>	<del>Slightly Soluble</del>
<del>Calcium Hypophosphite</del>	<del><math>\text{Ca}(\text{H}_2\text{PO}_2)_2</math></del>	<del>154</del>
Calcium Chloride	$\text{CaCl}_2$	745

# Site Relevant Speciation

- ▶  $\text{HPO}_4^{-2}$
- ▶  $\text{H}_2\text{PO}_4^{-}$
- ▶  $\text{H}_2\text{P}_3\text{O}_{10}^{-3}$
- ▶  $\text{HP}_3\text{O}_{10}^{-4}$
- ▶  $\text{H}_2\text{P}_2\text{O}_7^{-2}$
- ▶  $\text{HP}_2\text{O}_7^{-3}$

# Phosphate Relationships

## ► Phosphate

- Tripolyphosphate
  - Sorbs to sedimentary material (calcite, Fe and Al oxide, clay)
  - Forms fine ppt. w/ Ca
- Orthophosphate
  - Sorbs to sediment bound tripolyphosphate complexes increasing rate and degree of precipitation
- Pyrophosphate
  - Forms heavy, fast settling ppt. w/ Ca

## ► Calcium

# Column Testing

## ▶ Test Parameters

- $[P]_{\text{ortho/pyro/tripoly}}$
- Calcium/phosphorus ratio
- $[Ca]_{\text{total}}$  &  $[P]_{\text{total}}$
- pH of amendment solution

▶ Column Length = 1 ft

▶ Cross Sectional Area = 0.005 ft<sup>2</sup>

▶ Porosity = 0.25

▶ Flow Rate = 1.5 L/day

▶  $[U]_{\text{aq}} = 1000 \mu\text{g/L}$

# Uranium Column Testing

Total  $[P]_{aq} = 1.05 \times 10^{-2} \text{ M}$

Pyro  $[P]_{aq} = 2.63 \times 10^{-3} \text{ M}$

$[Ca]_{aq} = 2.32 \times 10^{-2} \text{ M}$

Tripoly  $[P]_{aq} = 3.94 \times 10^{-3} \text{ M}$

Ortho  $[P]_{aq} = 3.94 \times 10^{-3} \text{ M}$

pH adj. to 7

# Uranium Column Testing

Total  $[P]_{aq} = 5.26 \times 10^{-2} \text{ M}$

Pyro  $[P]_{aq} = 6.58 \times 10^{-3} \text{ M}$

$[Ca]_{aq} = 9.98 \times 10^{-2} \text{ M}$       $\text{pH} = 7$

Tripoly  $[P]_{aq} = 8.77 \times 10^{-3} \text{ M}$

Ortho  $[P]_{aq} = 1.32 \times 10^{-2} \text{ M}$

RT = 56 min     PV = 52 mL     PV = 1 Ca/ 1P

# Post-Test Preliminary Analysis

# Aqueous Uranium During Treatment

# Ongoing Injection Design Activities

- ▶ Intermediate scale column test (i.d. = 4", L = 10')
- ▶ Develop hydraulic property zonation in the vicinity of the test site
  - Lithologic descriptions
  - Hydraulic test data
  - Changes in hydraulic gradient
  - EBF testing (vertical distribution of  $K_h$ )
  - Tracer arrival data
- ▶ Perform predictive simulations to evaluate transport under high river stage conditions
- ▶ Polyphosphate injection planned for June 07 (high water table conditions)
